

Sinking boat

Can you make the boat sink?

Press the button to release air bubbles into the water.

What happens to the boat?

When the water is full of bubbles the boat sinks. It floats again when the bubbles have gone.

A boat will only float if it is lighter than water. The air bubbles in the water make it less dense so the boat no longer floats.

Kayakers and canoeists are afraid of „white water“ – disturbed water full of bubbles. This may cause them to sink.
